

## Milestone 1

For my final project I am currently interested in building a wholesale website. The company I work for has a wholesale order website from 2006 or later that desperately needs to be updated. While I know I will never convince my bosses to even consider changing a system that has been in place since they started selling their hats online, the idea of making one for my own sanity is still satisfying. If I were to continue with this idea, I would make few mock products, a cart system, a checkout, and an inventory of some kind. The customary would also need to see any orders that are placed. If it were to actually be used, it would also need a business-side account that could access all of the orders and change them if necessary. Because their current system doesn't accept any payment methods (as the orders are usually fulfilled much later with varying changes to the inventory), I wouldn't have to worry about storing any payment information. Just some sort of login credentials linked to an email.

Though I have no idea how difficult something like this would be, it at the very least sounds like the database created for InnovateHS last semester. If a few people can pull that off in a few weeks, I'm imagining being able to do something similar in an entire semester. However, it is likely I'll change my plan once I start learning what is capable when incorporating a database.
