

## Milestone

So far, I have all of my pages linked up and login officially working and have started working on linking together the proper sections of my database for the registration page. I still need to change the insert statements to prevent attacks though. I have the all users showing up on an admin page and have gotten a product to display from the database. I still have to work on the formatting so it shows up nicely in a grid, but at least the information is there. With this, I have the parts of my database currently in use built out.

---

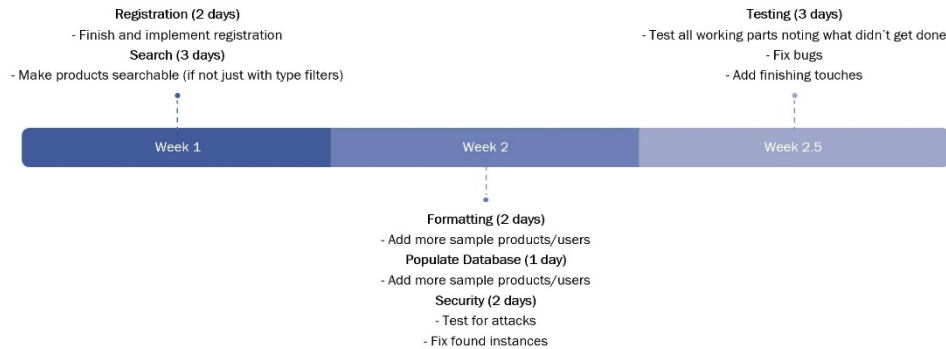

## CLASS TIMELINE

I definitely overestimated what I could get done, especially considering my old timeline made use of more time than I had. With this timeline, I would place myself somewhere between weeks 3 and 4, with all of the graphics being done from week 6.

---

## NEW TIMELINE

My current timeline cuts back on functionality. While it still makes use of the admin privileges I already added (seeing all users), it cuts back on a lot of the other functionality. This is mostly because I don't think I will be able to get an order system laid out in time. While I'm hoping to at least have products populate a cart visibly, I'm thinking the order system is beyond the scope of this project as it stands. We only have two and a half weeks left! So, my project will consist of a login, registration page, production section (with search/filters), a place to view user information, a few static pages, and products getting added to a cart. I would like to get as far as I can, but these are the elements I know I can get done before everything is due. The order system is the last bit that hasn't been built up and connected (aside from a few unused tables), and I want to have a few things that work well rather than everything I planned not working as expected.

This has been a great learning experience about scope, planning, and my ability as we learned parts I didn't even include in my timeline that definitely need to be implemented. I'm not

planning on purchasing the necessary domain and things to live host the project, because it isn't something I'm particularly interested in launching (at least in an unfinished state), but knowing the steps to do so in the future will no doubt be helpful in displaying my coding ability.
