

## Milestone 2

For my mock wholesale website, I will need to build a home page displaying large product imagery and company info for the client to see. This will be password protected. The users will be able to register as a company or login. Above should be a header with links for user info, orders, product collections, and a searchable directory that accepts both the specific item number/SKU, the name, the color, the style, and the price. Below will be the formatted display of the product as well as a text box to enter quantity (with a minimum of 3). The user should be able to add to the cart and view any current or previously fulfilled orders. In placing the order, the user will enter the PO#, add a ship window, and add any additional notes for the order (ex. discounts or a specific request). They will also be able to see a final review of their order. Once the order is placed, it will be possible to cancel or update it for a certain amount of time before the ship window. They should also be able to update all their personal information.

The admin side should have access to all of the above features as well as a comprehensive list of all of the orders that need to be fulfilled and the ability to mark them as such or delete them as necessary. If possible, an email notification would be sent to the buyer as the order is fulfilled. The admin will also be able to hide products for the buyer, adjust the inventory quantity, and make products unavailable as the stock drops below zero (this could also occur automatically). Lastly, to stay consistent with my jobs current system, there would need to be an area to store shipment information (tracking number) and the invoice number for later payment. I have no idea how long this would take to build, but I do have idea of the priority of what needs to be included in case I run out of time as I use the original website as both a buyer and an admin frequently.
